

Agentic Experience Assessment Reference

Use after designing a flow and before usability testing or release. Record evidence for every checked item; resolve all must-have gaps or document an accepted exception.

Prototype / flow:

Reviewer:

Review date:

Decision / follow-up owner:

1. Intent, scope, and boundaries

- ☐ **The user can identify the agent's goal, task, and expected outcome.**

Use plain language; do not make people infer intent.

- ☐ **Every action is labelled read-only or write, with data and system scope.**

Set expectations before execution.

- ☐ **Out-of-scope requests receive an honest refusal and nearest supported next step.**

- ☐ **Permissions, policy constraints, and sensitive-data boundaries are enforced.**

Must have

2. Human control and consent

- ☐ **Consequential writes require non-bypassable approval with action, records, impact, Confirm, and Cancel.**

Must have

- ☐ **Low-stakes acknowledgements use lightweight inline confirmation.**

- ☐ **Users can override recommendations; the flow honours and records their choice.**

- ☐ **Long-running work supports pause, cancel, and resume from a clear checkpoint.**

Must have

- ☐ **Delegated work is visible as a subtask and can be cancelled without losing parent context.**

3. Trust and transparency

- ☐ **Recommendations show a concise "Why this?" explanation and decision factors.**

- ☐ **AI insights show confidence; low confidence changes the interaction with a caution.**

- ☐ **Generated insights identify source data and last-updated time.**

Must have

- ☐ **Users can inspect what ran, what was read, and what was written.**

Must have

4. Execution, feedback, and recovery

- ☐ **Progress distinguishes waiting, running, completed, and paused states.**

- ☐ **Timeouts explain the delay and offer cancel or safe background continuation.**

- ☐ **Partial results preserve completed work, identify failure, and support retry from that step.**
Must have

- ☐ **Data-source failures identify the source and time, offer retry, and keep unaffected content available.**
Must have

5. Quality gate

- ☐ **Test success, refusal, approval, override, pause/resume, timeout, partial-result, and source-failure paths.**
Must have

- ☐ **Controls and status changes are keyboard accessible and understandable without colour alone.**
Must have

- ☐ **Copy is specific, calm, and does not overstate certainty, authority, or automation.**

- ☐ **A named owner accepts open risks, policy exceptions, and follow-up actions.**
Must have

- ☐ **Save the completed assessment with the release decision for later review.**

6. EU AI Act evidence beyond the prototype

- ☐ **Classify the intended use and risk profile with legal, risk, and product owners.**
Must have before any compliance claim

- ☐ **Provide evidence for data governance, quality, bias evaluation, and privacy controls.**

- ☐ **Provide technical documentation, traceable logs, cybersecurity, robustness, and accuracy testing evidence.**

- ☐ **Define post-market monitoring, incident handling, human-oversight procedures, and accountable owners.**
